Each winter, as Delhi wakes under a grey sky and the air thickens with smoke, the city relives a familiar crisis. Schools close, flights are delayed, and citizens scramble for masks as the Air Quality Index (AQI) routinely breaches 400 — the “severe” mark. Deepavali prompts a fresh round of breast-beating as the spate of firecrackers adds more smoke and pollutants to the already-unbreathable air. But this is not a seasonal inconvenience; it is a chronic public health emergency. And yet, year after year, we treat it as a passing nuisance rather than a structural failure.

## TEXT SUMMARY GENERATION

Each winter, as Delhi wakes under a grey sky and the air thickens with smoke, the city relives a familiar crisis. Schools close, flights are delayed, and citizens scramble for masks as the Air Quality Index (AQI) routinely breaches 400. Long-term exposure to Delhi's toxic air can reduce life expectancy by up to 10 years. People are relocating from Delhi, even at the cost of their careers, to avoid exposing their families and themselves to risks. Delhi urgently needs a Unified Airshed Management Plan that treats Delhi NCR as a single pollution zone. The three States must pool resources, align regulations and coordinate enforcement across their borders. We must also incentivise EV adoption, electrify public transport, expand metro networks, and deploy electric buses. With political will, it should not be impossible to regulate Pollution is not just a governance issue — it is a behavioural one. Campaigns, school programmes, and community initiatives must make clean air a shared responsibility.
